1 Purpose

The purpose of this Soil Management Plan is to assist the City of New Orleans – Department of Public Works in the safe management and disposal of soils excavated during completion of the RR029 Desire Neighborhood paving project. Figure 1 attached shows the site location. This plan details the evaluation of surface soil samples collected in the areas of planned infrastructure improvements. Specifically, this plan contains:

- A summary of current environmental conditions.
- On-site soil management best practices and recommendations.
- Recommendations for disposal of waste materials generated during the project, including approximate volumes indicated by the evaluation.

2 Background

The project site is within the former Agriculture Street Landfill (ASL) located in the Desire Neighborhood in the city of New Orleans, Louisiana. The ASL served as a municipal waste disposal area from approximately 1909 through 1957 and again for emergency purposes between 1965 and 1966. The area was subsequently developed during the 1970s and 1980s for residential purposes. In the 1990s, the United States Environmental Protection Agency (EPA) initiated a series of actions to protect residents from exposure to materials disposed of at this facility. Five operable units (OUs; OU-1 through OU-5) were established for management of remedies across the approximate 95-acre site. These OUs are depicted on Figure 2. All five OUs were determined to require no further action by 2002. OU-4 and OU-5 were deleted from the National Priorities List in 1997.

The previously mentioned RR029 paving project will be conducted within and in the vicinity of OU-2 and OU-3. The primary contaminant of concern (COC) for these OUs is lead. Additional contaminants of potential concern (COPCs) identified are arsenic and polycyclic aromatic hydrocarbons (PAHs). The response actions completed for these OUs consisted of removal of the top 24 inches of soil and waste materials, installation of a geotextile demarcation liner, and restoration to the original grade with clean fill. Response actions were primarily completed at residential properties; roadways were not included, and removal and replacement of sidewalks and driveways were completed only as necessary. The EPA determined that residential exposures to impacted soil below the demarcation liner had been mitigated where the response action was implemented. Nine private homeowners within OU-2 elected not to participate in the removal action. Four of these properties are located in the vicinity of the proposed paving project. Figure 2 depicts the locations of the parcels where the removal action was not completed.

Due to the historical operation of this facility and proximity of the paving project to properties not included in the removal action, soils generated during the process of facility improvements should be evaluated as potential waste materials for off-site disposal at a solid waste facility regulated by the Louisiana Department of Environmental Quality (LDEQ). The EPA has previously provided general guidance for utility projects, suggesting that clean backfill materials above the demarcation liner be stockpiled and reused on-site as needed. In order to formulate a comprehensive plan for management of all soils generated during the RR029 paving project, a sampling program was developed. This program involves confirming the concentrations of COCs and COPCs and recording other potential waste parameters at each proposed work area within the public right-of-way within the OU where removal action was completed, at properties not included in the removal action, and adjacent to the

OU. The sampling program detailed herein provides analytical data for soils present at each of the proposed work areas. The data have been used to evaluate the concentrations of COCs and COPCs detected in soils compared to EPA and LDEQ screening levels. The evaluation may be used to formulate decisions for reuse of these materials on-site as backfill or disposal off-site based on standards that are protective against human or ecological exposures.

3 Subsurface Investigation

Arcadis U.S., Inc. (Arcadis) collected composite soil samples from 20 different locations of the planned street and sidewalk improvements using a manual sampling device (hand auger) on July 14 through 16, 2021. Each composite sample was comprised of five individual aliquots of soil collected from the work area. Aliquots were obtained from the uppermost soils (i.e., 0 to 2 feet below surface grade). All five aliquots for the composite sample were placed into a stainless-steel bowl and thoroughly mixed to homogenize the sample. An exception to composite homogenization was performed for the collection of volatile organic compound (VOC) samples. A portion of the central composite aliquot was placed directly into the sample container prior to mixing the remainder of the aliquot. This was done to minimize any losses due to volatilization of analytes during the homogenization process. All sample locations (labeled Comp-1 thru Comp-20 and identified on Figure 2) were selected based on the remaining work to be completed. Soils were sampled at proposed crosswalk, ramp, and road-surface replacement locations so that each could be characterized individually. Concrete from roadways, ramps, and sidewalks, and associated soils underneath, were not sampled during this sampling event, but further investigation will be completed prior to construction activities to adequately characterize the environmental conditions and provide recommendations for soil management at these locations. All soil samples were placed into laboratory-provided sample containers, packed with ice in a cooler at ≤4 degrees centigrade, and shipped to Pace Analytical Laboratories (Pace) in New Orleans, Louisiana, under full chain-of-custody protocol. Sampling forms completed for each sampling location are included as Appendix A

3.1 Analytical Program

The collected soil samples were analyzed for the following parameters, which include the COCs and COPCs for the ASL site, conventional solid and hazardous waste COCs, and waste characterization parameters.

- VOCs by EPA Method 8260
- Semi-Volatile Organic Compounds (SVOCs; including PAHs) by EPA Method 8270D
- Resource Conservation and Recovery Act Metals by EPA Method 6010/7074
- Chlorinated Pesticides by EPA Method 8081
- Herbicides by EPA Method 8151
- Polychlorinated Biphenyls by EPA Method 8082
- Reactivity
- Corrosivity
- Ignitability

- Paint Filter Liquids

3.2 Analytical Results

The soil analytical results for each constituent at the 20 sampling locations are summarized in Tables 1 through 3. For consistency of approach, LDEQ Risk Evaluation/Corrective Action Program (RECAP) screening standards (SS) have been used as the preliminary comparative criteria for human health and environmental evaluation. It is acknowledged that the EPA has established regional screening levels for many of the same compounds. To be comprehensive, these standards have also been included for reference. It is also acknowledged that risk-based standards and medium specific screening levels have been developed for several COPCs specific to the site. In particular, the following excerpt from the second five-year review report pertains to the selection of appropriate comparison criteria for lead and arsenic (Second Five-Year Review Report for the Agriculture Street Landfill Superfund Site, New Orleans, Orleans Parish, Louisiana, Region 6 United States Environmental Protection Agency April 2008):

> *The EE/CA compared EPA Region 6 RBC levels to site soil concentrations. The lead RBC was 480 milligrams per kilogram (mg/kg – mg/kg is equivalent to ppm) and the arsenic RBC was 0.370 mg/kg (EPA, 2003). The current EPA Region 6 Human Health Medium Specific Screening Levels (MSSLs) for arsenic and lead for residential exposure are 22 mg/kg and 400 mg/kg, respectively. The State of Louisiana adopted the RECAP in December 1998, and became final on October 20, 2003. The RECAP soil standards for arsenic and lead for surface soil and potential surface soil at non industrial sites are 12 mg/kg and 400 mg/kg, respectively. The EPA Region 6 MSSL and LDEQ RECAP standard for lead in soil are lower than the lead RBC used as the cleanup goal at the site. However, the highest lead level detected in the soil samples collected during the post-Katrina sampling event was 363 mg/kg, which was lower than 400 mg/kg (Section 6.4). These standards may be considered if additional response actions are found to be required at the site in the future.*

Copies of the laboratory analytical reports are provided as Appendix B.

As shown in Table 1, analytical results exceed the LDEQ RECAP SS as follows (and indicated by gray shading in Table 1):

1. Soil screening standard based on the protection of human health for non-industrial land use ($Soil_{SSni}$).
   a. Pesticides:
      - Sample Comp-11:
        - Dichloro-diphenyl-dichloroethylene (4,4'-DDE): 2.46 milligrams per kilogram (mg/kg)
        - Dichloro-diphenyl-trichloroethane (4,4'-DDT): 2.62 mg/kg

   b. SVOCs:
      - Sample Comp-04:
        - Benzo(a)anthracene: 0.9 mg/kg
        - Benzo(a)pyrene: 1.5 mg/kg
        - Benzo(b)fluoranthene: 2.5 mg/kg
        - Bis(2-ethylhexyl)phthalate: 64.2 mg/kg

   c. Metals:
      - Arsenic:

    - Sample Comp-05: 15.7 mg/kg
    - Sample Comp-11: 13.7
  - Cadmium:
    - Sample Comp-05: 5.2 mg/kg
  - Lead:
    - Sample Comp-05: 1320 mg/kg

2. These detections are above the RECAP SS for soil protective of groundwater ($Soil_{SSGW}$) meeting the definitions of Groundwater Classifications 1, 2, and 3.

   a. Pesticides:
      - Sample Comp-11:
        - 4,4'-DDE: 2.46 mg/kg

   b. Metals:
      - Lead
        - Sample Comp-01: 259 mg/kg
        - Sample Comp-03: 195 mg/kg
        - Sample Comp-04: 361 mg/kg
        - Sample Comp-05: 1,320 mg/kg
        - Sample Comp-10: 159 mg/kg
        - Sample Comp-11: 352 mg/kg
        - Sample Comp-19: 137 mg/kg
        - Sample Comp-20: 141 mg/kg

The $Soil_{SSni}$ comparative results indicate the presence of COCs and COPCs in the vicinity of sample locations Comp-04, Comp-05, and Comp 11 at concentrations that would require additional evaluation of site-specific direct-contact non-industrial exposure criteria. Alternatively, these concentrations would suggest that the soil is not suitable for unrestricted reuse on-site at default exposure parameters.

The $Soil_{SSGW}$ comparative results indicate the presence of COCs and COPCs in the vicinity of sample locations Comp-01, Comp-03, Comp-04, Comp-05, Comp-10, Comp-11, Comp-19, and Comp-20 at concentrations that could result in cross-media transfer (soil to groundwater). Such cross-media transfer SS are based on generic (non-site-specific) criteria, which include protection of potable aquifers in addition to non-potable aquifers that may drain to surface-water bodies. Evaluation of these concentrations in consideration of site-specific exposure criteria would be required for reuse of soils at several of these locations. Alternatively, additional evaluation of the potential for soil-to-groundwater leaching can be performed by use of a leach test. This additional evaluation by use of a leach test was performed, and results met $Soil_{SSGW}$ SS, indicating that soil at locations Comp-01, Comp-03, Comp-10, Comp-19, and Comp-20 could be reused on-site. Leach test results at locations Comp-04, Comp-05, and Comp-11 also met $Soil_{SSGW}$ SS, eliminating the soil-to-groundwater pathway. However, these locations had exceedances of the $Soil_{SSni}$ standard as discussed above, and therefore, soil is not suitable for unrestricted reuse on-site. The leach test results and evaluation are further detailed in Section 3.2.1.

3.2.1 TCLP Evaluation

The toxicity characteristic leaching procedure (TCLP) analysis can be used to determine the potential for leaching of toxic compounds from soil. TCLP analyses were conducted on soil samples collected in this investigation for

two purposes: 1) to evaluate off-site waste disposal requirements; and 2) to further evaluate the lead soil-to-groundwater pathway at the locations where the $Soil_{SSGW}$ SS were exceeded.

Arcadis first performed a provisional evaluation of the total concentrations for potentially hazardous COCs using the "Rule of 20" modification of total analysis results. As presented in Table 3, all total sample results were divided by 20 to account for the theoretical maximum leachate concentration resulting from a 20:1 ratio of extraction fluid to solid sample. The detection limit was used for samples where non-detect values were reported. This evaluation of the theoretical leachate concentration suggested that concentrations of lead reported for several samples could be in excess of the Federal Resource Conservation and Recovery Act (RCRA) threshold for leachate from lead-containing wastes.

Arcadis ordered Pace to analyze samples Comp-04 and Comp-05 for TCLP using EPA Method 6010C to further evaluate lead concentrations. Comp-05 represents the highest concentration identified during the field investigation, and Comp-04 represents the second highest concentration. Both detections of lead in the original sample are in excess of the $Soil_{SSGW}$ standard, which represents a generic numerical value above which a COC may potentially migrate from soil into groundwater. The characteristics of soils in some localities tend to resist the leaching effect and therefore may not result in a cross-media transfer risk even if the screening criteria are exceeded. TCLP analysis simulates the leaching from soil to groundwater that may occur under landfill conditions and is an approximation of the concentration of pore waters that have come into direct contact with the COC-containing soil. The analysis also allows for comparison of the analytical results with the Federal TCLP Regulatory Limits for non-hazardous waste obtained from 40 Code of Federal Regulations Part 261. Analytical results for the TCLP analysis (Table 2) indicate a non-detect concentration of <0.2 milligram per liter (mg/L) in both samples, which is below the maximum regulatory level for lead of 5 mg/l for solid waste disposal. These results, along with the results presented in Table 3, indicate that the soils can be profiled and disposed of as non-hazardous waste.

In accordance with RECAP Appendix H1.1.1, a leachate-based SS is calculated by multiplying the standard protective of a Classification 1 aquifer (GW_1) by the default Summers model dilution factor ($DF_{Summers}$). For lead, the product of GW_1 (0.015mg/L) multiplied by $DF_{Summers}$ (20) is 0.3mg/L. Because the result of the leachate analysis is less than 0.3 mg/L, the lead concentrations in soil are determined to be protective of groundwater and the pathway may be eliminated from further consideration. This elimination refers to concentrations of lead detected at locations Comp-01, Comp-03, Comp-04, Comp-05, Comp-10, Comp-11, Comp-19, and Comp-20. TCLP was not performed for the pesticide 4,4'-DDE as that constituent also exceeds the non-industrial SS.

3.2.2 Other Waste-Specific Characterization

In addition to the COC and COPC analyses, additional sample volumes were collected for analysis of conventional waste characterization parameters that are required for off-site waste disposal, including reactivity, flashpoint, and free liquids. None of the samples exhibited the characteristic of having a flashpoint less than 140 degrees Fahrenheit. Likewise, there were no instances of samples exceeding the reactive cyanide or sulfide standards of 250 mg/kg or 500 mg/kg, respectively.

Samples Comp-07 and Comp-08 failed the paint filter liquid test, indicating that the high moisture content of soils at these locations may result in liquefaction during transport. As this is a physical parameter only, material-handling procedures may be implemented to stabilize the material if needed.

3.2.3 Interpretation

COC and COPC concentrations located at Comp-04, Comp-05, and Comp-11 exceed the SS for direct-contact exposure. Sample locations Comp-04 and Comp-05 are located within the bounds of the ASL OU-2. The majority of surface soils within OU-2 were remediated during the removal action conducted by the EPA. However, as previously referenced, four properties located adjacent to Benefit Street were not included in the removal action at the election of the owners. The exceedances identified by this evaluation at locations Comp-04 and Comp-05 are associated with the property on the corner of Gordon Plaza Drive and Benefit Street, which was opted-out for removal action. Correspondingly, shallow soils at these locations should be considered non-remediated and are indicative of historical landfill materials as evidenced by the detections of PAH and lead at Comp-04 and arsenic, cadmium, and lead at Comp-05.

Locations Comp-01, Comp-03, and Comp-06 are also associated with properties that were not included in the EPA removal action at the election of the owners. While sampling results (including TCLP analyses) from this investigation indicate that COC and COPC concentrations at these locations are below screening levels, soils removed from these areas should be considered for off-site disposal as a conservative measure. Similarly, materials removed from the roadways during construction should be disposed of off-site because these areas were also not included in the removal action.

Comp-11 is located adjacent to the bounds of OU-2 and OU-3 near the intersection of Benefit Street and Montegut Street. Detections of arsenic just over the statewide background of 12 mg/kg were reported at this location. Additionally, pesticides 4,4'-DDE and 4,4'-DDT were detected at this location at concentrations exceeding the RECAP $Soil_{SSni}$ and $Soil_{SSGW}$ (4,4'-DDE only). As identified by the EPA's summary of the site history (Appendix B of the July 2018 Fourth Five-Year Review Report), pesticides (specifically 4,4'-DDT) were reportedly sprayed at the ASL site during the 1940s and 1950s. Because this location is adjacent to, but outside of, OU-2 and OU-3, it is possible that shallow soils here could contain residual concentrations of COCs and COPCs. Further soil investigation activities will be completed in areas adjacent to the OUs prior to construction to adequately characterize the environmental conditions and provide recommendations for soil management at these locations.

Analytical results (in consideration of TCLP analyses) indicate that the $Soil_{SSni}$ standard should be used as screening criteria for all concentrations detected during this investigation. Locations where detected concentrations are above the $Soil_{SSni}$ and/or locations that were not previously remediated should be considered for disposal. Soils at remaining locations where detected concentrations are below the $Soil_{SSni}$ could be reused/replaced following construction activities.

The following table summarizes the analytical results and the recommended soil management approach for each location sampled in this investigation.

Sample Location	Included in EPA Removal Action?	Meets RECAP SS?		Eligible for On-Site Soil Reuse?(1)
		$Soil_{SSni}$	$Soil_{SSGW}$	
Comp-01	**No**	Yes	**No(2)**	**No**
Comp-02	Yes	Yes	Yes	Yes
Comp-03	**No**	Yes	**No(2)**	**No**
Comp-04	**No**	**No**	**No(2)**	**No**

Sample Location	Included in EPA Removal Action?	Meets RECAP SS?		Eligible for On-Site Soil Reuse?(1)
		$Soil_{SSni}$	$Soil_{SSGW}$	
Comp-05	**No**	**No**	**No(2)**	**No**
Comp-06	**No**	Yes	Yes	**No**
Comp-07	Yes	Yes	Yes	Yes
Comp-08	Yes	Yes	Yes	Yes
Comp-09	Yes	Yes	Yes	Yes
Comp-10	Yes	Yes	**No(2)**	Yes
Comp-11	Yes	**No**	**No(2)**	**No**
Comp-12	Yes	Yes	Yes	Yes
Comp-13	Yes	Yes	Yes	Yes
Comp-14	Yes	Yes	Yes	Yes
Comp-15	Yes	Yes	Yes	Yes
Comp-16	Yes	Yes	Yes	Yes
Comp-17	Yes	Yes	Yes	Yes
Comp-18	Yes	Yes	Yes	Yes
Comp-19	Yes	Yes	**No(2)**	Yes
Comp-20	Yes	Yes	**No(2)**	Yes

Notes:
(1)Locations marked as not eligible for on-site soil reuse should be hauled off-site by a licensed waste hauler to a solid waste landfill or soil treatment facility permitted by the State of Louisiana. Waste characterization results indicate the materials can be disposed of as a non-hazardous solid waste. Stabilizing material may be required based on paint filter liquid test results (Section 3.2.2).
(2)Result exceeded $Soil_{SSGW}$ RECAP SS; however, the soil-to-groundwater pathway was eliminated by additional TCLP evaluation as described in Section 3.2.1.

Abbreviations:

EPA	United States Environmental Protection Agency.
RECAP SS	Risk Evaluation/Corrective Action Program screening standard.
$Soil_{SSGW}$	Screening standard for the soil concentration protective of groundwater meeting the definitions of Groundwater Classifications 1, 2, and 3.
$SoilSS_{ni}$	Soil screening standard based on the protection of human health for non-industrial land use.
TCLP	Toxicity Characteristic Leaching Procedure.

4 Soil Management Plan

Based on the results of the soil sampling activities described in Section 3, Arcadis recommends the following.

4.1 Soil Reuse

Surface soils (from ground surface to a maximum depth of 2 feet below surface or above the geotextile liner, whichever is first encountered) at locations Comp-02, Comp-07, Comp-08, Comp-09, Comp-10, Comp-12, Comp-13, Comp-14, Comp-15, Comp-16, Comp-17, Comp-18, Comp-19, and Comp-20 may be returned to the

ground following completion of pavement improvements in these areas. This determination is based on the analysis within Section 3 that indicates concentrations of COCs and COPCs detected in these areas do not exceed direct-contact SS and were previously remediated under the EPA removal actions. While soil results from locations Comp-01, Comp-03, and Comp-06 indicated compliance with the screening levels in this evaluation, these areas are located within portions of OU-2 that were not included in the removal action and therefore should be considered for off-site disposal as a conservative measure. Similarly, materials removed from the roadways that were not included in the removal action will not be considered for reuse on-site.

4.2 Soil Disposal

Chemical analyses detailed herein indicate that surface soils up to a depth of 2 feet below surface grade that will be removed from the proximity of the sample areas within OU-2 may be profiled as solid waste. Tables 2 and 3 summarize the regulatory thresholds for hazardous waste parameters in relation to observed site concentrations. As previously described in Section 3.2.1, the TCLP analysis of lead indicates compliance with the RCRA limit of 5 mg/L. This was the only compound that necessitated TCLP analysis following the use of the “Rule of 20” approximation of the maximum theoretical leachate concentration derived from total results in comparison to the applicable hazardous waste criteria. Additionally, there were no exceedances of the RCRA criteria for physical hazards (flashpoint, reactive cyanide, and sulfide). It should be noted that additional sampling to be conducted in the roadways should include waste characterization analysis to confirm disposal requirements for materials removed from those areas.

Based on the obtained analytical results described in Section 3, excavated soils in the vicinity of sample locations Comp-04, Comp-05, and Comp-11 exceed applicable RECAP and EPA screening levels. It is appropriate to consider for disposal soils located in the vicinity of samples Comp-04, Comp-05, and Comp-11 as a public safeguard. Additionally, soils and materials from areas not included in the previous removal actions (Comp-01, Comp-03, Comp-06, and roadways) should also be considered for off-site disposal. The excavated soil from these areas should be either stockpiled (within roll-off containers) for disposal or directly loaded and hauled to a solid waste disposal facility permitted by the State of Louisiana. Live load into waiting disposal trucks is the preferred technique.

If stockpiling for disposal is utilized, a containment structure should be erected prior to excavation of the material. This structure should consist of an impermeable polyethylene sheet ground barrier laid over a continuous, 360-degree berm. Stockpiled soil shall be placed directly on the impermeable surface and covered with a polyethylene sheet tent until the soil is ready for disposal. Stakes or weights placed along the edges of the tent cover should be used to prevent ponding of rainwater within the containment. The stockpile containment structure should be located within a fence-secured area to restrict access to excavated material. As possible, this fenced area should encompass the excavation area and will be considered an exclusion zone. Additional site control and access restriction measures are discussed in Section 5.1. The soil should be hauled off-site by a licensed waste hauler to a solid waste landfill or soil treatment facility permitted by the State of Louisiana. Transportation and disposal of this material should occur as promptly as possible. The EPA has provided additional guidance regarding materials handling (Erosion Control Technical Discussion, Technical Abstract – Utilities, July 1998). These documents should be consulted by the contractor in advance of excavation.

4.3 Concrete/Surface Material Disposal

Sampling of constructed surface materials (asphalt and concrete) was not within the scope of this investigation. Although asphalt and concrete may typically be recycled or disposed of within construction and demolition landfill facilities, due to the mechanism of emplacement and removal from the site, these materials could contain residual amounts of soil clinging to their surfaces that could reasonably be expected to contain similar concentrations to the composite soil samples collected from each area. For this reason, it is recommended that concrete and asphalt removed from locations Comp-01, Comp-03, Comp-04, Comp-05, Comp-06, and Comp-11 be disposed of as solid waste in the same shipment and facility as the soils. Disposal at the same facility will provide a public safeguard against contact with residual soils and will allow for a more rapid execution of the improvements.

Concrete and asphalt removed from all other sample locations may be directed to a construction and demolition debris landfill or recycled as necessary because the soils collected from these locations did not exceed direct-contact exposure criteria. As previously described, TCLP analysis indicates that residual soils clinging to these materials would not be expected to leach COCs at concentrations that would result in potential exposures.

4.4 Confirmatory Soil Sampling

Should any excavation be conducted beyond 2 feet below surface elevation or below the demarcation liner in areas of the OU where removal action was completed, additional soil sampling and analysis of that horizon should be completed. The previously mentioned Technical Abstract – Utilities provides guidance for this potential occurrence. Specifically, soils encountered below the demarcation liner should be considered representative of historical landfill material and should be segregated from the surface soils for use as backfill only below the liner as prescribed by the EPA. Alternatively, materials from beneath the liner may be characterized and disposed of at a permitted facility as necessary.

4.5 Backfill/Resurface of Excavated Areas

After the excavation activities have been completed, excavations shall be backfilled as needed using clean soil fill. Backfilling shall be made in 2-foot lifts with compaction provided by compacting equipment. A soil density test by Modified Proctor Method (ASTM D1557) should be conducted in each lift to verify density of 95 percent or better. The excavation shall be backfilled to grade and restored to pre-existing condition.

5 Pre-Field Activities

This section on pre-field activities includes descriptions of planning and organizational aspects required for excavation to begin.

5.1 Site Security and Access

During remediation activities, the site will remain secured to provide protection for on-site personnel and equipment and to prevent unauthorized access to the site. The work will be done within the public right-of-way. A 6-foot-high chain-link fence comprised of temporary panels should enclose the staging area and the work zones (i.e., all exclusion, decontamination, and support zones). During non-working hours, the fencing will be fully

closed and locked. During excavation activities, access will be restricted to authorized personnel only. All excavations, stockpiled materials, and equipment will be located within this restricted access area. Signage will be posted to discourage trespassing.

5.2 Traffic Control

Caution will be exercised during entrance into and exit from the site to ensure safe and uninterrupted traffic flow. Entrance into and departure from the site by trucks will be facilitated by support personnel as necessary. Once trucks have left the site, they will follow specific haul routes to disposal facilities that will be determined based on final disposal arrangements. A detailed Traffic Control Plan will be prepared prior to excavation implementation. Refer to Section 6.4, Off-Site Soil Disposal and Transportation Plan, for more information.

5.3 Excavation Permit

All necessary permits for removal activities, transportation, and/or air quality will be obtained prior to excavation. The permits will be kept on-site during the work and made available for inspection during working hours. The procedures proposed for excavation activities will comply with Federal, State, and local rules and regulations regardless of whether permit documents are required.

5.4 Notifications and Utility Clearance

The contractor will notify the City of New Orleans, LDEQ, and EPA of excavation activities 2 months prior to implementation. The proposed excavation areas will be marked in white paint prior to contacting Louisiana One Call (811) at least 72 hours prior to excavating, as required by law. A private utility-locating service will also be utilized to mark and clear proposed excavation locations relative to the presence and/or marked locations of potential subsurface utilities.

5.5 Soil Management

Excavated soil will be reused on-site where applicable or transported off-site for disposal as described in Section 4. Suitable fill material (“clean soil”) is soil that will not have an adverse effect on human health or the environment when imported to the receiving site.

5.6 Excavation of Non-Impacted Soil

Excavation of the non-impacted soil at each excavation area (Comp-02, Comp-07, Comp-08, Comp-09, Comp-10, Comp-12, Comp-13, Comp-14, Comp-15, Comp-16, Comp-17, Comp-18, Comp-19, and Comp-20) at depths ranging from ground surface to 2 feet below ground surface will be conducted in the following general sequence:

1. Develop exclusion zones, staging areas, and access paths for equipment, work zones, and decontamination areas for use during handling of soil to reduce the potential of tracking materials off-site.
2. Identify locations of perimeter air-monitoring stations as necessary, and begin monitoring to comply with the Health and Safety Plan (HASP) and the protocols in Section 7 of this Soil Management Plan.
3. Excavate and stockpile non-impacted soil for reuse on-site.

4. Utilize plastic sheeting to cover each stockpile and excavated area as needed for weather protection. Additional weather protection protocols are discussed further in Section 6.6.

5.7 Excavation of Impacted Soil

Excavation of the impacted soil (containing SVOCS, lead, or pesticides or at locations previously not remediated) at each excavation area at depths ranging from ground surface to 2 feet below ground surface will be conducted in the following general sequence:

1. Develop exclusion zones, staging areas, and access paths for equipment, work zones, and decontamination areas for use during handling of impacted soil to reduce the potential of tracking waste off-site.
2. Identify locations of perimeter air-monitoring stations as necessary, and begin monitoring to comply with the HASP and the protocols in Section 7 of this plan.
3. Direct load onto trucks or place into secured stockpiles as described in Section 4.2 for appropriate off-site disposal.
4. Utilize plastic sheeting to cover each stockpile and excavated area as needed for weather protection. Additional weather protection protocols are discussed further in Section 6.6.

6 Waste Management

6.1 Soil Characterization Prior to Off-Site Disposal

Soil has been pre-characterized by laboratory analysis and can be loaded directly onto trucks for transport to the receiving facility once the appropriate off-site disposal location and permitting have been completed. It is also recommended that additional waste characterization samples be collected from the roadway areas in future investigations to verify the waste disposal requirements from materials removed in those areas.

Although unlikely, some soil may need to be placed in temporary on-site stockpiles because: (a) the soil requires further characterization prior to off-site disposal; (b) short-term storage is necessary until haul trucks are available to transport the soil off-site for disposal; or (c) the soil needs processing or sorting prior to landfilling. If possible, roll-off containers shall be used to contain the stockpiles because they can be secured against trespass and weather by locking and covering with a tarp. All stockpile areas should be contained within the restricted access work area described in Section 5.1 to prevent access to the materials.

6.2 Soil Stockpile Management

Soil that is placed in temporary stockpiles will be well maintained at all times to prevent run-on/run-off and fugitive dust emissions and odor. All stockpiled soil will be placed on impermeable plastic sheeting (minimum 10-mil thick). The plastic sheeting will prevent the run-off of soil and potential contaminants to surrounding areas. The soil stockpile will be covered with plastic sheeting when not actively being added to or removed to prevent erosion or contaminant impacts to underlying soil and prevent exposure to precipitation and wind. Plastic sheeting that covers the soil stockpile will be secured using sandbags or an equivalent. If direct load of soil onto trucks for immediate off-site disposal cannot be accomplished, stockpiles will be secured during work that day and removed

as soon as possible. Following removal, the soil stockpile area will be restored to a pre-stockpile condition. Following stockpile removal, residual plastic or debris will also be disposed of in a proper manner.

6.3 Decontamination Procedures

To prevent residual contamination from leaving the site by construction equipment and personnel during excavation activities, the following decontamination procedures will be followed:

- To minimize the spread of impacted soil, equipment will be cleaned prior to movement out of active work zones.
- The equipment wheels/tires will be cleaned over plastic sheeting using shovels and stiff-bristled brooms or brushes until they are fully cleaned.
- Workers will follow decontamination procedures to prevent the spread of impacted soil, including brushing boots until they are fully cleaned and removing soiled personal protective equipment (gloves, protective work clothing) prior to leaving the active work zone.
- Upon completion of cleaning, any debris will be placed in the appropriate transportation vessel and the plastic sheeting will be folded and disposed of in a proper manner.

6.4 Off-Site Soil Disposal and Transportation Plan

In advance of the excavation activities, a detailed Traffic Control Plan will be developed that will:

- Minimize the distances trucks will travel on residential streets.
- Provide the most safe and expedient route out of the Desire Neighborhood.
- Minimize transportation during portions of the day when there may be high traffic or an increased pedestrian presence.
- Specify load limits for all roadways, culverts, and bridges.
- Specify maximum speeds for each portion of the roadway.
- Provide detailed guidance for on-site transit and loading operations.

The Traffic Control Plan will be included in the construction bid plans and specifications.

Following acceptance of the excavated soil at an appropriate licensed disposal facility, the soil will be loaded in licensed haul trucks (end-dumps or transfers) and transported off-site following appropriate Federal and State waste-manifesting procedures and the above-mentioned Traffic Control Plan. The appropriate waste-manifest documentation will be provided to truck drivers hauling the impacted soil off-site. Based on the areas identified for off-site disposal in the above sections, the approximate volume of material to be hauled is estimated to be 150 tons. This volume represents a preliminary estimate and is subject to change through the course of construction.

Transportation equipment will be chosen to safely transport the expected volumes of soil, taking into consideration the types of roads to be traveled and their loading capacity. Routine truck maintenance and repairs will be performed at the transporter's premises prior to picking up loads of waste material from the site.

After each truck is filled, an inspection will be conducted to verify that the waste soil is securely covered to the extent practicable and that the tires of the haul trucks are reasonably free of accumulated soil prior to leaving the site. During loading, dust and odor emissions will be monitored and mitigated as necessary. During transportation, the hauling trucks will be equipped to fully cover all soil and debris, such as with a heavy tarpaulin. A street sweeper will be made available, as needed, to keep the surrounding streets clean. The soil will be wetted as necessary to reduce the potential for dust generation during loading and transportation activities.

A detailed truck/soil-load log associated with off-site transport/disposal from the site will be maintained. The log will include, at a minimum, the date and time trucks were loaded and off-loaded, the destination, the size (volume and weight) of the load, a description of contents, the name and signature of the hauler, and the name and signature of the contractor's representative. The waste will be off-loaded for treatment or disposal in a manner consistent with current Federal, State, and local regulations. Shipments of hazardous waste, if applicable, will be tracked with the appropriate hazardous waste manifests.

All transportation activities will be performed in strict compliance with all regulations and ordinances. Any hauling contractor who transports non-hazardous waste from the site or clean fill to the site will be fully licensed and permitted by the State of Louisiana. All Department of Transportation and Louisiana State Police safety regulations will be strictly followed by non-hazardous waste haulers. Transportation routes will be developed to minimize the transporting of impacted soil through residential areas. The impacted soil will be transported via surface streets to the closest suitable freeway. The remainder of the freeway route(s) will be established upon selection of the appropriate landfill(s).

6.5 Off-Site Disposal Facilities

If soil is classified as non-hazardous waste by Federal and State standards, it will be disposed of at a Class II licensed landfill facility such as:

- Greater New Orleans Landfill, Avondale, Louisiana.
- River Birch Landfill, Avondale, Louisiana.
- Colonial Landfill, Sorrento, Louisiana.

A full listing of permitted Class II landfills should be consulted prior to work execution to verify permit status.

6.6 Wastewater and Groundwater Management Protocols

No wastewater resulting from groundwater infiltration is anticipated to be generated during any phases of remedial excavation activities due to the limited depth of excavation. Excavations shall not be left open for a prolonged period of time nor allowed to gather rainwater. Excavations shall be lined with an impermeable material such as polyethylene. Any water gathered within the polyethylene liner that has not contacted soil may be pumped as necessary to the storm drainage system.

Other environmental controls may be required if anticipated conditions at the site change. If excavation activities occur during the rainy season, water management procedures will be implemented in addition to probable modifications of other plans such as the HASP. The following procedures will be implemented at the site during the rainy season:

- The weather forecast will be monitored. During days heavy rain is forecasted, excavation activities may not occur.

- The boundary of the work area will be properly bermed to prevent storm water from entering or leaving the work area.
- Storm water entering the excavation area from non-impacted areas and storm water originating within the excavated area will be pumped to settlement tanks and treated prior to discharge under permit or disposal off-site.
- Excavation will be conducted in small sections such that the exposed excavated area can be covered immediately if heavy rains occur.
- Procedures will be used to prevent wet soil from sticking to the tires of trucks used to haul soil off-site. These procedures may include plastic sheeting at the loading area, a tire wash at site egress paths, and/or a stabilized gravel construction entrance.
- Plastic sheeting will be used extensively to cover the area of excavation during non-work hours.

In general, the excavation will be kept as dry as possible to minimize the waste generated, and the backfilling of the excavation, as necessary, will be conducted promptly. Storm water best management practices (BMPs) will be followed in accordance with the contractor's Grading Plans to be prepared for the site. The BMPs for the site activities should include use of fiber rolls, inlet protection, stabilized construction entrance, landscape and paving, street cleaning, and catch basin cleaning.

6.7 Spill Response Plan

In the event of a spill, the contractor will be responsible and prepared to respond in a safe and efficient manner to the particular spill. Standards will be set and consistent procedures used for handling spills, whether they are on-site spills or spills that occurred during transportation. Haulers will have an Emergency Spill Contingency Plan (ESCP) to ensure that all drivers and dispatchers know their responsibilities in the unlikely event that an accidental spill occurs while transporting impacted material off-site. The drivers and dispatchers will be required to know the procedures for emergency spill response. The ESCP will meet or exceed all Federal, State, and parish regulations currently in effect. Strict adherence to the provisions of the ESCP will be followed to ensure continued protection of public safety and the environment. The HASP will address the handling of on-site spills.

7 Dust and Odor Emissions

During excavation activities, depending on soil and weather conditions, there is potential to generate airborne dust and fugitive vapor emissions. Standard dust and fugitive vapor emission control measures will be followed during the ground-disturbing activities to comply with Occupational Safety and Health Administration (OSHA) rules and to accomplish the following goals:

- Reduce the potential for health impacts to workers.
- Reduce the potential for health impacts to neighbors.
- Prevent violations of ambient air quality standards.
- Minimize nuisance dust complaints from neighbors.
- Minimize the migration of contaminants adhered to fugitive dust particles outside the site.

7.1 Erosion, Dust, and Odor Control Measures

Once existing vegetation or surface pavements are stripped from the site where necessary, the exposed soil will become susceptible to erosion by wind and water. Therefore, erosion control measures and dust control measures will be in place before construction begins. Emission (dust) control measures will at a minimum comply with those established by OSHA for construction-related activities. Dust control measures will be based on BMPs and will be used throughout excavation activities and during site restoration activities following excavation, including the backfill and compaction of engineered fill at the site.

7.2 Construction Mitigation Measures

The following basic mitigation measures will be implemented in accordance with standard practices.

- All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) will be watered two times per day.
- All haul trucks transporting soil, sand, or other loose material off-site will be covered.
- All visible mud or dirt track-out onto adjacent public roads will be removed.
- Idling times will be minimized either by shutting equipment off when not in use or reducing the maximum idling time to 5 minutes. Clear signage will be provided for construction workers at all access points.
- All equipment will be maintained and properly tuned in accordance with manufacturer specifications. All equipment will be checked by a certified mechanic and determined to be running in proper condition prior to operation.

7.3 Dust Suppression Measures

If dust is excessive, some or all of the following mitigation procedures may be implemented:

- Keep active work areas adjacent to residences damp at all times.
- Apply water or (non-toxic) soil stabilizers to unpaved access roads, parking areas, and staging areas.
- Sweep (with water sweepers) paved access roads, parking areas, and staging areas.
- Cover or otherwise stabilize exposed soil stockpiles.
- Suspend activities that cause visible dust plumes and odor to extend beyond the limits of the site.

7.4 Odor and Vapor Suppression Measures

By controlling the dust as described above, the emission of odor and vapors should be reduced to levels that likely will not pose a risk to the health of the public or site workers. The water spray used to control dust will also significantly reduce the emissions of any potential volatiles that may be present in the soil. The selective loading and transportation of impacted soils could minimize the use of soil stockpiling, further reducing potential emissions of volatiles. Stockpiles of impacted soil or exposed excavation left overnight at the site will be properly covered with plastic sheeting to minimize emissions of volatiles.

Other emissions include exhaust from heavy equipment. The equipment proposed for the site redevelopment will be maintained properly so that exhaust emissions will be within acceptable standards.

As deemed necessary, the following mitigation procedures may be implemented in the event of excessive odors:

- Chemical suppressants mixed with water will be applied using various applications such as spray or mist.
- Plastic sheeting will cover the sidewalls of the trench during non-active excavation activities to minimize the migration of VOCs and odors.
- Alternative work sequencing will be conducted such that excavation of soil with potential odor during mid-day or afternoon (during hot weather) will be avoided. Any highly odorous soil could be segregated and placed inside a roll-off bin equipped with a lid to minimize the amount of highly odorous soil during loading.
- Planned excavation and transportation activities will be balanced such that the need for large stockpiles is reduced.

7.5 Air Monitoring

To the extent feasible, the presence of airborne contaminants will be evaluated through the use of portable monitoring equipment. Information gathered will be used to ensure the adequacy of the levels of protection being employed at the site and may be used as the basis for upgrading or downgrading levels of personal protection at the discretion of the Site Health and Safety Officer. In addition, sampling equipment will be utilized to monitor for the potential off-site migration of contaminants (i.e., fence-line monitoring). Such monitoring will take into consideration and incorporate the off-site receptor type, wind direction, work tasks being performed, etc.

The following air-sampling equipment will be utilized for site monitoring will serving as the primary instruments for personal exposure monitoring. They will be utilized to fully characterize potential employee exposure and the need for equipment upgrades/ downgrades.

- Dust monitors (DataRAM™ pDR-1000AN Monitor).
- MiniRae™ Photoionization Detector.

8 Conclusion

On July 14 through 16, 2021, Arcadis collected composite soil samples from 20 locations corresponding to planned street and sidewalk improvements. Samples were analyzed for COCs and COPCs identified for the ASL Superfund site, conventional solid and hazardous waste COCs, and waste characterization parameters. Based on the analytical results, it is concluded that the soil excavated in the vicinities of Comp-4, Comp-5, and Comp-11 should be disposed of at a permitted solid waste facility and not be reused on-site. The procedures outlined in this Soil Management Plan should be followed to minimize risks to workers and residents and environmental exposures.

Notes:
Shading indicates that a detection exceeds the limiting LDEQ Screening Standard.
Bold Above detection limit.

Abbreviations:
D3 Sample was diluted due to presence of high levels of non-target analytes or other matrix interference.
D4 Sample was diluted due to presence of high levels of target analytes.
E Analyte concentration exceeded calibration range. Reported result is estimated.
EPA United States Environmental Protection Agency.
L0 Analyte recovery in LCS was outside QC limits.
M1 Matrix spike recovery exceeded QC limits. Batch accepted based on LCS recovery.
MH Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
R1 Relative percent difference value was outside control limits.
LCS Laboratory control sample.
LDEQ Louisiana Department of Environmental Quality.
mg/kg Milligram per kilogram.
NAV Not available.
QC Quality control.
RECAP SS Risk Evaluation/Corrective Action Program Screening Standards.
$Soil_{SSGW}$ Screening standard for the soil concentration protective of groundwater meeting the definitions of Groundwater Classifications 1, 2, and 3.
$Soil_{SSi}$ Screening standard for the soil concentration protective of industrial/commercial land use.
$Soil_{SSni}$ Soil screening standard based on the protection of human health for for non-industrial land use.

Notes:
All sample results for Comp-01 through Comp-20 have been converted for comparison to the TCLP criteria by dividing the result by 20. Detection limits were used for non-detect results.
[1]Regulatory Limits for nonhazardous waste obtained from 40 CFR Part 261.
Shading indicates that a concentration exceeds the TCLP/20 rule.

Abbreviations:
mg/L Milligram per liter.
CFR Code of Federal Regulations.
RCRA Resource Conservation and Recovery Act.
TCLP Toxicity Characteristic Leaching Procedure.

Soil Sampling Logs

ARCADIS

SOIL/SEDIMENT SAMPLING LOG

PROJECT NAME: City of N.O. DPW-DESIRE Soil Sampling Event

PROJECT NUMBER: 30058527.03 DATE: _____

SITE LOCATION: Desire Neighborhood (Group D)

SAMPLE ID NUMBER: Comp-01 CODED/REPLICATE NO.: NA

TIME SAMPLING BEGAN: 0840 ENDING: 0850

WEATHER: Partly Cldy, warm, humid

SITE DESCRIPTION: Residential Corner Benefit / St. Ferdinand

SAMPLING DATA

COLLECTION METHOD: HAND Auger - Composite

DEPTH: 0-2 MOISTURE CONTENT: Low

COLOR: Dk brown ODOR: NONE

DESCRIPTION: SANDY SILT w/ some clay, gravel, roots

ANALYSES REQUIRED	CONTAINER DESCRIPTION FROM LAB: X OR ARCADIS:
8260 RECAP	TERRACORE KIT
8270 SVOC	4oz jar
RCRA Metals	4oz jar
8081 Pest./PCBs	8oz jar
8151 Herbicides	4oz jar
RCI + Paint Filter Liquids	8oz jar
TCLP-Metals (HOLD)	8oz jar (HOLD)

SAMPLING MONITORING (TIP, OVA, HNU, etc.) N/A

RE: Project: Desire 30058527.03.1
Pace Project No.: 20214666

Dear George Cook:

Enclosed are the analytical results for sample(s) received by the laboratory on July 15, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace National - Mt. Juliet
- Pace Analytical Services - New Orleans

08/09/2021 - This is a revised report to add TCLP Pb to samples -004 and -006.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Clay Ledet
clay.ledet@pacelabs.com

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
1000 Riverbend Blvd - Suite F
St. Rose, LA 70087
(504)469-0333

ANALYTICAL RESULTS

Project: Desire 30058527.03.1
Pace Project No.: 20214666

Sample: Comp-03 **Lab ID: 20214666003** Collected: 07/14/21 10:48 Received: 07/15/21 06:30 Matrix: Solid

Results reported on a "wet-weight" basis

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
1000 Riverbend Blvd - Suite F
St. Rose, LA 70087
(504)469-0333

ANALYTICAL RESULTS

Project: Desire 30058527.03.1
Pace Project No.: 20214666

Sample: Comp-06 **Lab ID: 20214666007** Collected: 07/14/21 14:30 Received: 07/15/21 06:30 Matrix: Solid

Results reported on a "wet-weight" basis

Parameters	Results	Units	Report Limit	DF	Prepared	Analyzed	CAS No.	Qual

QUALIFIERS

Project: Desire 30058527.03.1
Pace Project No.: 20214666

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The Nelac Institute

WORKORDER QUALIFIERS

WO: 20214666

[1]	Site ID fixed to match sending lab sample IDs.

ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
D4	Sample was diluted due to the presence of high levels of target analytes.
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
P9	RPD between the primary and confirmatory analysis exceeded 40%.
R1	RPD value was outside control limits.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.

RE: Project: Desire 30058527.03.1
Pace Project No.: 20214794

Dear George Cook:

Enclosed are the analytical results for sample(s) received by the laboratory on July 16, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace National - Mt. Juliet
- Pace Analytical Services - New Orleans

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Clay Ledet

QUALIFIERS

Project: Desire 30058527.03.1
Pace Project No.: 20214794

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The Nelac Institute

BATCH QUALIFIERS

Batch: 231890

[M5]	A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
P9	RPD between the primary and confirmatory analysis exceeded 40%.
R1	RPD value was outside control limits.
S4	Surrogate recovery not evaluated against control limits due to sample dilution.
ST	Surrogate recovery was above laboratory control limits. Results may be biased high.

RE: Project: Desire 30058527.03.1
Pace Project No.: 20214890

Dear George Cook:

Enclosed are the analytical results for sample(s) received by the laboratory on July 16, 2021. The results relate only to the samples included in this report. Results reported herein conform to the applicable TNI/NELAC Standards and the laboratory's Quality Manual, where applicable, unless otherwise noted in the body of the report.

The test results provided in this final report were generated by each of the following laboratories within the Pace Network:

- Pace National - Mt. Juliet
- Pace Analytical Services - New Orleans

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Clay Ledet

REPORT OF LABORATORY ANALYSIS

Pace Analytical Services, LLC
1000 Riverbend Blvd - Suite F
St. Rose, LA 70087
(504)469-0333

QUALIFIERS

Project: Desire 30058527.03.1
Pace Project No.: 20214890

DEFINITIONS

DF - Dilution Factor, if reported, represents the factor applied to the reported data due to dilution of the sample aliquot.

ND - Not Detected at or above adjusted reporting limit.

TNTC - Too Numerous To Count

J - Estimated concentration above the adjusted method detection limit and below the adjusted reporting limit.

MDL - Adjusted Method Detection Limit.

PQL - Practical Quantitation Limit.

RL - Reporting Limit - The lowest concentration value that meets project requirements for quantitative data with known precision and bias for a specific analyte in a specific matrix.

S - Surrogate

1,2-Diphenylhydrazine decomposes to and cannot be separated from Azobenzene using Method 8270. The result for each analyte is a combined concentration.

Consistent with EPA guidelines, unrounded data are displayed and have been used to calculate % recovery and RPD values.

LCS(D) - Laboratory Control Sample (Duplicate)

MS(D) - Matrix Spike (Duplicate)

DUP - Sample Duplicate

RPD - Relative Percent Difference

NC - Not Calculable.

SG - Silica Gel - Clean-Up

U - Indicates the compound was analyzed for, but not detected.

N-Nitrosodiphenylamine decomposes and cannot be separated from Diphenylamine using Method 8270. The result reported for each analyte is a combined concentration.

Pace Analytical is TNI accredited. Contact your Pace PM for the current list of accredited analytes.

TNI - The Nelac Institute

SAMPLE QUALIFIERS

Sample: 20214890004

[1] Polychlorinated Biphenyls (GC) by Method 8082 - Surrogate failure due to matrix interference

Sample: 20214890005

[1] Polychlorinated Biphenyls (GC) by Method 8082 - Surrogate failure due to matrix interference

BATCH QUALIFIERS

Batch: 231890

[M5] A matrix spike/matrix spike duplicate was not performed for this batch due to insufficient sample volume.

ANALYTE QUALIFIERS

D3	Sample was diluted due to the presence of high levels of non-target analytes or other matrix interference.
D4	Sample was diluted due to the presence of high levels of target analytes.
E	Analyte concentration exceeded the calibration range. The reported result is estimated.
L0	Analyte recovery in the laboratory control sample (LCS) was outside QC limits.
M1	Matrix spike recovery exceeded QC limits. Batch accepted based on laboratory control sample (LCS) recovery.
MH	Matrix spike recovery and/or matrix spike duplicate recovery was above laboratory control limits. Result may be biased high.
P9	RPD between the primary and confirmatory analysis exceeded 40%.
R1	RPD value was outside control limits.
